

HAZARDMODDING COOP MOD FOR SIN RELOADED

This Modification is FREE of charge and has to be presented and provided as such, at all times!

DEVELOPMENT STARTED OCTOBER 2026.

ABOUT

This modification is dedicated to the memory of Richard "Levelord" Gray.

The **HaZardModding Coop Mod: SiN Reloaded,** is a free open-source project started by Chrissstrahl and developed by HaZardModding.
It allows up to 4 players to play (parts of) the game cooperatively.

SiN Reloaded Coop builds upon Chrissstrahl's 20 years of experience developing cooperative modifications for games using Ritual Entertainment's ÜberTools technology.

Hand-coded, AI-assisted.

Over 150 hours of human development and testing have gone into this modification so far. ChatGPT's estimated contribution to the overall development process is approximately 5%. It was primarily used for technical research, debugging, documentation, generating new images, enhancing screenshots and existing images as well as generating generic math functions or rewriting existing helper code for a new purpose.
Code that is generated is marked with // Generated by ChatGPT

This modification is level-script based no modified binary files needed.

Table of contents

Are you the missing man?

Help to test and develop SiN Reloaded Coop Mod!

This is how you can help:

- Contribute on GitHub directly to the development of the level scripts, which make up most of the work.
- Contribute as a Tester, make suggestions and report bugs.

The modification features multiplayer compatible replacements for script commands and reusable scripting framework for:

- Cinematic cutscenes
- Player handling like: Spawn, Death, Spectator, Disconnect
- Predefined and dynamic spawnlocations
- Equiping player inventory upon spawn
- Player distance and proximity checks
- Automatic detection of the closest player
- Player validity and alive-state detection

GOG GALAXY

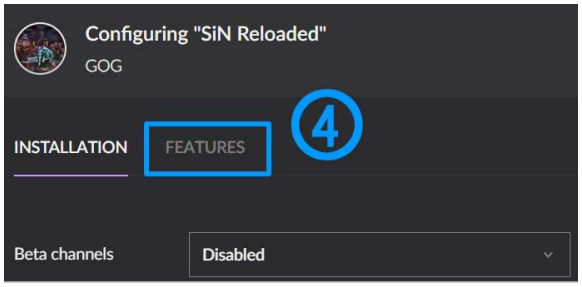

- Select the list of installed games, then select **SiN Reloaded**.
- 1. Click the '**Settings**' Button at the top, next to 'Play'
- 2. Select: '**Manage Installation**' then select:'**Show folder**'
- 3. Follow now step by step the Installation instructions

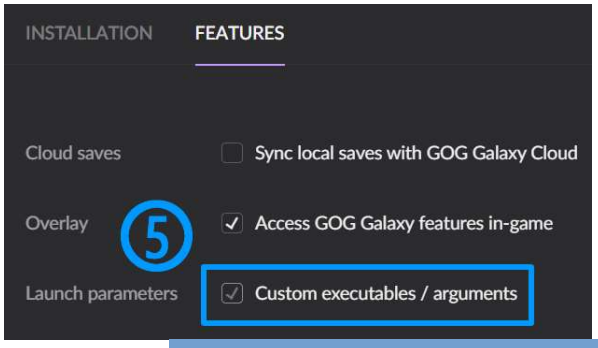

To play the mod using GOG Galaxy you need to set start parameters.

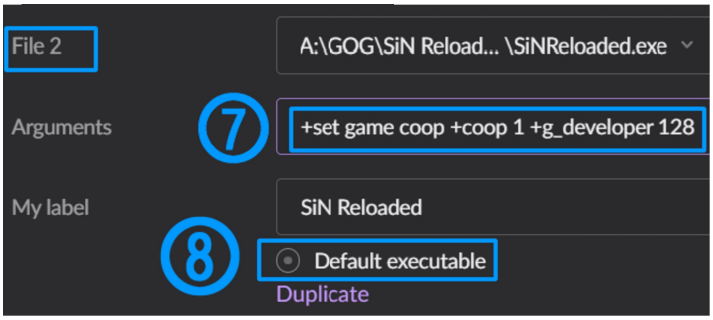

1. Click on the '**Settings**' Button
2. Click on '**Manage installation**'
3. Select '**Configure**'

4. In the new Window select '**Features**'

5. Select '**Custom executables / arguments**'

6. Click on '**Dublicate**'

7. At '**File2**' in '**Arguments**' add the start parameters:
+set game coop +coop 1 +g_developer 128
8. Click on '**Default executable**' – *the circle will turn white*
9. Click on OK at the bottom and you are done.

INSTALLATION

The HaZardModding Coop Mod may not be compatible with other modifications, except Graphics/Texture Mods.

[1] Make sure you have a clean/fresh game installation
[2] Make sure you use the latest version, or use the GOG release.
[3] Copy folder 'coop' with its contents inti the game main directory next, but **not inside** /base/ the folder.

JOINING A SERVER

Instructions will follow for...

gog version (LAN only)
steam version (Steam Internet and LAN)

STARTING A SERVER

Instructions will follow for…

gog version (LAN only)
steam version (Steam Internet and LAN)

If you start multiple instances of the game the port will shift up.
Start Server first to make it will use the default port. Players can then connect without entering the port. Close all instances of the game to make the server start at the default port again.

Others may not be able to see your server in the server list unless:

- you use the Steam version of SiN Reloaded
- your server can actually connect to the Internet 

To test if your server can be joined, start another instance of the game, then open the console, type connect then Space, then your ***external*** IP-Address like:
`connect 89.22.456.11`

You need a "IPv4 IP-Address" for others to join your server.

Even if your server is not visible on the Server List, others may still be able to join by entering your external IP-Address.

Your external IP-Address should be displayed in your Router or any other device that handles your access to the Internet.

In the console of the dedicated server you can enter **status** to see if the server is working. And **sv_port** to check which port the server is actually using.

CONSOLE

Before you can open the **console** you need to **enable** it in **Options** → **Advanced** → enable checkbox **Console**.

The Key to access the console depends on your Keyboard Layout and Language. Please try pressing these Keys while you are in the game: ^ , °, ², ³, @, <, ~ or ’

UN-INSTALLATION

- **Remove the files added during the Installation.**
